5As of Pediatric Obesity Management

Canadian Obesity Network
Detour

Obesity management is about improving health and well-being, and not simply reducing numbers on the scale.

Interventions should include addressing ‘root causes’ of obesity and removing roadblocks for families to make healthy changes.

A Child’s ‘Best’ BMI May Never Be His or Her ‘Ideal’ BMI

Weight bias can be a barrier to weight management.

Unhealthy weight gain may result from poor eating habits or reduced physical activity secondary to biological, psychological or socioeconomic factors.

Weight related complications (e.g. sleep apnea, hypertension, hyperlipidemia, diabetes) can also pose significant barriers to weight management.

Obesity is often a chronic condition. A child’s “best” BMI is achieved through sustained positive health behaviours.

It is important to help children and their families improve body image and move towards body size acceptance.

Fear of judgment can prevent parents from seeking health care support for their children. Making assumptions about a family’s health behaviours can lead to an ineffective intervention.

Success is different for every child and family.

Interventions should include addressing ‘root causes’ of obesity and removing roadblocks for families to make healthy changes.

Successful weight management requires identifying and addressing (1) the ‘root causes’ of unhealthy weight gain and (2) barriers to health and well-being.

Unhealthy weight gain may result from poor eating habits or reduced physical activity secondary to biological, psychological or socioeconomic factors.

Weight related complications (e.g. sleep apnea, hypertension, hyperlipidemia, diabetes) can also pose significant barriers to weight management.

An “ideal” BMI is not a realistic goal for many children with obesity, and setting unachievable targets can set-up children and families for failure.

Obesity is often a chronic condition. A child’s “best” BMI is achieved through sustained positive health behaviours.

It is important to help children and their families improve body image and move towards body size acceptance.

Families differ considerably in their readiness and capacity for weight management.

Success can be defined as better quality-of-life, greater self-esteem, higher energy levels, improved overall health, prevention of further weight gain, modest weight loss, or maintenance of the children’s “best” BMI.

Key Principles

Success is different for every child and family

Interventions should include addressing ‘root causes’ of obesity and removing roadblocks for families to make healthy changes

Becoming overweight or obese is not our child’s fault.

A Child’s ‘Best’ BMI May Never Be His or Her ‘Ideal’ BMI

Weight bias can be a barrier to weight management.

Unhealthy weight gain may result from poor eating habits or reduced physical activity secondary to biological, psychological or socioeconomic factors.

Weight related complications (e.g. sleep apnea, hypertension, hyperlipidemia, diabetes) can also pose significant barriers to weight management.

Obesity is often a chronic condition. A child’s “best” BMI is achieved through sustained positive health behaviours.

It is important to help children and their families improve body image and move towards body size acceptance.

Families differ considerably in their readiness and capacity for weight management.

Success can be defined as better quality-of-life, greater self-esteem, higher energy levels, improved overall health, prevention of further weight gain, modest weight loss, or maintenance of the children’s “best” BMI.

Key Principles

Obesity management is about improving health and well-being, and not simply reducing numbers on the scale.

Weight management success should be measured in changes in health behaviours and improvement in overall health—how/what you eat, how you move and how you cope, rather than the number on the scale. Changing health behaviours can lead to significant improvements in health and well-being with little or no change in body weight.

Weight bias can be a barrier to weight management.

Weight bias in children can negatively impact self-esteem, quality of life and lead to social isolation.

Children with obesity are often victims of bullying and stigmatization.

Fear of judgment can prevent parents from seeking health care support for their children.

Making assumptions about a family’s health behaviours can lead to an ineffective intervention.
**Ask** for permission to discuss weight

Weight is a sensitive issue. Many children and parents may be embarrassed or fear blame and stigma, so ‘asking’ is an important first step.

**Be Non-Judgemental**

- Do NOT blame, threaten, or provoke guilt in children or parents.
- Do NOT make assumptions about children’s lifestyles or motivation; they may already be living a healthy lifestyle or have started to make changes.
- Do acknowledge that weight management is difficult and hard to sustain.

**Explore Readiness for Change**

Determining children’s and parents’ readiness for behaviour change is essential for success. Recognize that children & their parents may be at different stages. Use a family-centred, collaborative approach.

Initiating change when children and/or parents are not ready can result in frustration and may hamper future attempts to make healthy changes.

**Use Motivational Interviewing to Move Families Along the Stages of Change**

Ask questions, listen to responses, and reply in a way that validates experiences and acknowledges that children and parents are in control of their treatment plan.

If they are NOT ready for change, be prepared to address their concerns and other health issues. Then, ask if you can speak with them about health behaviours in the future.

**Sample Questions on How to Begin a Conversation about Weight:**

- “Are you concerned about your (child’s) health?”
- “Are you concerned about your (child’s) weight?”
- “Would it be alright if we discussed your (child’s) weight?”

Depending on the age and developmental stage of children, it may be more appropriate to speak with parents alone.

**Create a Weight-Friendly Practice**

- Facilities: wide doors, large restrooms, floor-mounted toilets.
- Scales: over 350lb/160kg capacity, wheel-on accessible, located in private area and used with sensitive weighing procedures.
- Waiting room: sturdy, armless chairs, appropriate reading material – no glossy fashion magazines.
- Exam room: appropriate-sized gowns, wide and sturdy exam tables, extra-large blood pressure cuffs, longer needles and turniquets, long-handled shoe horns.
ASSESS obesity related risk and potential ‘root causes’ of weight gain

Assess Obesity Status and Stage

Obesity status in children is defined using BMI growth charts specific for age and gender.
- CDC > 95th percentile
- WHO > 97th percentile

Obesity Stage is based on the 4Ms (Mental, Mechanical, Metabolic and Milieu), which quantify the impact of obesity on children’s overall health.

Assess Obesity Drivers, Complications, and Barriers

Use the 4Ms framework to assess Mental, Mechanical, Metabolic, and Milieu drivers, complications, and barriers to weight management. Within the framework, be sure to assess for physical activity, sedentary behaviours, and eating behaviours.

Consider the following when assessing for etiology of obesity: low growth velocity (endocrine), dysmorphic features/neurocognitive delay (genetic syndrome), onset before 6-months of age (monogenic), and brain tumors (hypothalamic obesity). However, the most common form of obesity is “acquired.”

The 4Ms of Obesity

**Mental**
- Anxiety
- Depression
- Body Image
- ADHD
- Sleep Disorder
- Eating Disorder
- Trauma

**Mechanical**
- Sleep Apnea
- MSK pain
- Reflux Disease
- Encopresis
- Enuresis
- Intertrigo

**Metabolic**
- IGT/Type II Diabetes
- Dyslipidemia
- Hypertension
- Fatty Liver
- Gallstones
- PCOS
- Medication
- Genetics

**Milieu**
- Parent Health/Disability
- Family Stressors
- Family Income
- Bullying/Stigma
- School Attendance
- School Support
- Neighbourhood Safety
- Medical Insurance
- Accessible Facilities
- Food Environment
- Opportunities for Physical Activity
ADVISE on obesity risks, discuss treatment benefits & options

Advise on Obesity Risks

Obesity risks are more related to the OBESITY STAGE than to BMI.

Focus of management should be on IMPROVING HEALTH and WELL-BEING rather than simply losing weight.

Explain Benefits of Modest Weight Loss

The first goal is to STABILIZE BMI

Changes in health behaviours can result in substantial health benefits including improvements in:

- Lipid profile
- Blood glucose control
- Blood pressure control
- Fitness
- Sleep
- Body image
- Self-esteem
- Coping

Explain Need for Long-Term Strategy

Relapse is virtually inevitable when any intervention stops.

This means that all management strategies must be FEASIBLE and SUSTAINABLE.

Interventions focusing on “quick fixes” and unsustainable strategies will result in an inability to maintain health behaviours over time.

Advise on Family-Based Treatment Options

SLEEP management interventions can significantly improve eating and activity behaviours as well as mood and school performance.

EATING BEHAVIOURS should focus on eating & drinking hygiene. Extreme and “fad” diets are not sustainable in the long-term.

PHYSICAL ACTIVITY interventions should aim at reducing sedentariness and increasing daily physical activity levels to promote fitness, overall health, and general well-being, rather than focusing on “burning calories”.

SEDENTARY BEHAVIOUR should be limited by minimizing recreational screen time to less than 2 hours per day, choosing active transportation over motorized, and increasing active play and active family time.

MENTAL HEALTH treatment referrals can help manage underlying /co-morbid psychological issues. Interventions can improve body-esteem, self-esteem, reduce emotional eating, and promote healthy coping strategies.

BARIATRIC SURGERY may be considered for adolescents who’ve reached their final adult height, with BMI > 40, and with obesity related health complications. Candidates and their families are required to have completed a multi-disciplinary 6-month presurgical intervention.
Agree on Sustainable Behavioural Goals
Focus on sustainable behavioural changes rather than on specific weight targets.

Behavioural goals should be SMART:
- Specific
- Measurable
- Achievable
- Rewarding
- Timely

Agree on a realistic SMART plan to achieve health behaviour outcomes

Agree on Behaviour Change Outcomes
Unrealistic weight-loss expectations can lead to DISAPPOINTMENT and NON-ADHERENCE.
For some children, PREVENTION or SLOWING of WEIGHT GAIN may be the best goal.

Agree on Treatment Plan
Management plans should be REALISTIC and SUSTAINABLE. Be mindful of need to set goals with both children and parents as their goals may differ.

Management plans should begin with ADDRESSING the DRIVERS of unhealthy weight gain (e.g. anxiety, sleep apnea, fatty liver, family stressors, etc.)
The SUCCESS of treatment should be measured in improvements in HEALTH and WELL-BEING (e.g. self-esteem, body image, sleep, fitness, blood glucose, etc.)
ASSIST in addressing drivers & barriers, offer education & resources, refer to provider, and arrange follow-up

Assist Families in Identifying and Addressing Drivers and Barriers
Drivers and barriers may include ENVIRONMENTAL, SOCIOECONOMICAL, EMOTIONAL, or MEDICAL factors.

Obesogenic MEDICATIONS (e.g. atypical antipsychotics, anti-diabetics, anti-convulsants, etc.) may make obesity management difficult.

PHYSICAL BARRIERS that limit access (e.g. transportation, turnstiles, limited seating, etc.) in school settings, work places, and recreational facilities may deter active participation in everyday life.

Provide Education and Resources
Family EDUCATION is central to successful management.
Help children and their families identify CREDIBLE weight management information and resources.

Refer to Appropriate Provider
Evidence supports the need for an INTERDISCIPLINARY team approach.
Choice of appropriate provider (e.g. physician, nurse, dietitian, psychologist, social worker, exercise physiologist, physiotherapist/occupational therapist, surgeon, etc.) should reflect identified DRIVERS and COMPLICATIONS of obesity as well as BARRIERS to weight management.

Arrange Follow-Up
Given the chronic nature of obesity, LONG-TERM follow-up is ESSENTIAL.
Success is directly related to FREQUENCY of provider contact.
Weight cycling and weight gain should not be framed as “failure” – rather, they are the natural and expected consequence of dealing with chronic condition.
